## SETNX:

SETNX is string command which is used to set value to a specific key, one and only if the key does not exist. It return value 1 or 0.

- 1 indicates that the value has been set to the key.

- 0 indicates that the value has not been set to the key since the key already owns some value in it.

SYNTAX:

SETNX KEY VALUE

EXAMPLE:

Here

1 = value is set successfully.

0 = value is not set successfully.
